The Analytics, Assets, and Performance Branch has received a data request from the Associate Director of Public Space Division. The associate director needs to know the average business days to approve construction permits. She wants to see overall performance and the average business days to approve different permit types.

She also needs you to provide insight into the approval time data. Your analysis will not include an explanatory factor for approval times. You do not need to provide statistical analysis. You only need to provide helpful data segmentation to inform the next steps for deeper exploration.

The Associate Director of Public Space Division has asked for the results in a Tableau Workbook.

**You will create a Tableau workbook with an analysis of average business days to approve Public Space Construction Permits in the fiscal year 2026. Your analysis will include helpful data segmentation that reveals where approval times are meaningfully different.**

## Data Requirements

Filter construction permits using the following criteria:

- Permit application dates should be equal to or after October 1st, 2025.
- Only *new* permits that have been *issued* in FY26.
- Business Day approval calculations should exclude weekends and District of Columbia holidays.

**There is no data dictionary available. You will need to explore the data and determine how best to categorize different types of permits and segment data.**

## Data Source

Our Construction Permit data is available via a REST Services feed here:
https://maps2.dcgis.dc.gov/dcgis/rest/services/DCGIS_APPS/DDOT_TOPS/MapServer/23

## Helpful Data Check and Exploration Tool

You can look up individual permit and tracking number data here.

https://tops.ddot.dc.gov/DDOTPERMITSYSTEM/DDOTPERMITonline/landing.aspx

## Deliverables Summary

- The **packaged Tableau workbook**. There should be a *minimum* of three worksheets and one dashboard:
    - (1) a worksheet with the average business days to close,
    - (2) a worksheet with the average business days to close for each permit type category,
    - (3) a worksheet that provides another helpful data segment to understand average days to approve, and
    - (4) a dashboard that combines these analysis sheets. The dashboard should have a structured layout, a title, section titles, and text and/or design features to help guide the user.
- You may include as many worksheets as you want.
- You may include additional purpose-built data sources.
- This deliverable can be a rough draft design. **Do not worry about spending time on a final polished design. We prefer to see your data insights.**
- All files should be compressed into a .zip folder with the following name,
    - *FirstName_MiddleInitial_LastName*_Tableau.zip

## Additional Guidance

If you get stuck and run out of time, don't worry! Partially functional workbooks are fine to submit. You are also welcome to submit narrative documents explaining your approach and how you planned to handle any issues with more time. We would rather see incomplete work than nothing at all.

Use of AI is expected. District government only has access to Copilot, but you may use any AI tool to complete your work. All these data sources are publicly available.
